Industrial hemp agronomy: Northern Prairie focus

Jan J. Slaski Ph.D., P.Ag. (Dist.) Vegreville

St. Paul - March 30, 2017 Whitecourt - April 4, 2017

Establishing hemp as a mainstream crop for industrial applications

Hemp fibre has great potential to be a valuable feedstock for several well established industries.

To realize potential residing within this crop InnoTech Alberta assembled a program offering solutions from "Seed to final product "

- Feedstock development
- Fibre processing
- Biocomposite research
- Market development

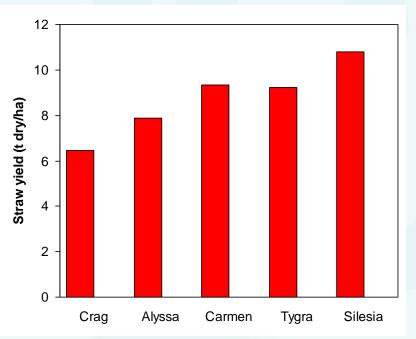

Feedstock development research goals

To secure supply of fibre of uniform quality and quantity and to reduce costs of fibre production

Hemp selection and breeding

- Germplasm evaluation
- Selection of top performers under AB conditions
- Maintenance breeding of cv. Silesia
- Initiation of new cultivars breeding for Alberta

InnoTech Alberta Agronomy Trials

Objective:

Optimization of cultivation practices for Alberta (at the Vegreville site)

- Seeding dates (mid May- mid June)
- Seeding densities (100 and 250/300 seed/m²)
- Fertilizers (cattle manure, mineral)
- N rates and forms (ammonia, urea)
- Harvest dates (for juvenile fibre)
- Herbicide resistance

ACIDF supported 3 y trials at Lethbridge, Vegreville and Falher

Final report will be available in March 2018

Hemp varieties in Alberta

Variety	2014	2015	2016
Finola	7403	5751	4525.42
X59	1471	2994	3217.44
CFX2	1394	969	828.4
CRS1	65	0	0
Katani	0	108	745.15
Grandi	0	64	199.7
Picolo	0	54	3416.83
Other	10	0	4.4
Total	10343	9940	12937.34

Seedbed preparation

- Hemp is very sensitive to soil structure; yield penalty on compacted soils
- Does not tolerate soils with poor drainage

Water logging - 2016 Falher

Water logging – 2016 Vegreville

Seeding

- Seed shallow ~ ½ inch (or into moisture)
- 20-25 lbs/acre seeding rate for grain
- 40-60 lbc/ac for fibre
- Warm soils above 8°C
- Equipment low fan speed for air seeders

Drought on slopes

Fertilization

- Present rule of thumb: "As much nitrogen as I can afford"
- Otherwords N as for high protein wheat or canola
- Our ongoing research will verify this recommendations

Pests and diseases

- Sclerotinia avoid rotation with canola
- Botrytis (grey mold)

Insects – not a real problem

- Bertha armyworm
- Cutworm
- Grasshoppers

Roundup drift

Spring frost

Hemp is fairly resistant to spring frost

-4.7°C on May 30, 2015

Hail injuries

- Extent of damage depends on:
 - plant stage
 - usage type
- Symptoms leaf
 shredding, stem
 bruising, kinking and/or
 breaking of stalks, loss
 of flower heads

Recovery from hail injury

Birds – grain contamination

When to harvest grain?

Seeds begin to become exposed outside the protective bract

Harvesting grain (and fibre)

- Harvest at 85% seed maturity (12-20 % moisture)
- Wrapping is a problem
- Newer rotary combines work better than conventional
- Swathing is possible (in southern AB)

https://www.youtube.com/watch?feature=player_embedded&v=vb6MvPBPnL4

Harvesting fibre

- Easier than grain
- For high quality fiber soon after pollen is shed (70-90 DAS)
- For biocomposites can be harvested at seed maturity

Retting

A process of beginning to separate the bast fibres from the hurds

- Types: field dew retting, tank retting, enzymatic/chemical
- Length of field retting 4-6 weeks to complete
- Critical for optimum fibre yield and quality

Baling

Grain storage

- Depends on variety, hemp is harvested at 12 - 20% seed moisture
- Start drying immediately (same day) after combining
- Slow speed augers (avoid cracking)
- Use high capacity fans, turn if moisture over 15%
- Do not overheat (oil will get rancid) <45°C plenum
- Long term storage at 8-10%
 moisture
 InnoTech

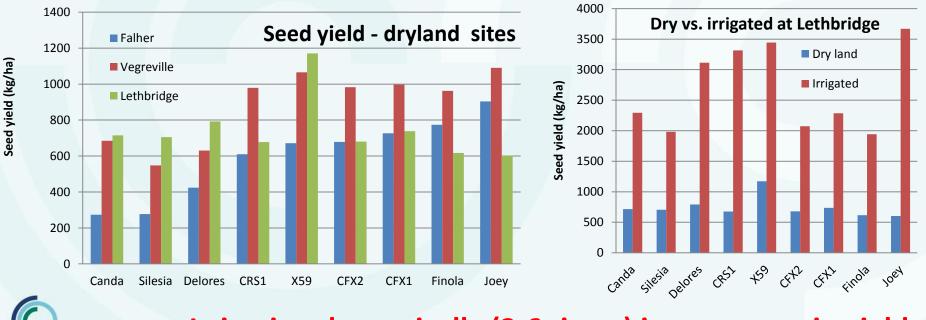

Improper storage - Microbial contamination issue

Attainable yields – AB trials

Yield range in commercial conventional dryland production:

- Grain 100-1500 kg/ha
- Fibre 1000-12000 kg/ha

Irrigation dramatically (3-6 times) increases grain yield

Fibre yields across Alberta

Fibre yield - dryland sites

8000 12000 7000 Dry land Falher 10000 Fibre yield (kg/ha) Fibre yield (kg/ha) 6000 Irrigated Vegreville 8000 5000 L - Dry 4000 6000 3000 4000 2000 2000 1000 0 0 CEX2 Finola CFX2 459 CASI Cardo Delores CFX2 Finola CFX1 X59 CRS1 Canda Delores Joey Silesia

Dry vs. irrigated at Lethbridge

silesia

Joet

- High fibre yields in the northern portion of the province
- Irrigation increases fibre yield of dual purpose cultivars

Fibre processing

Decortication – separation of hemp stem

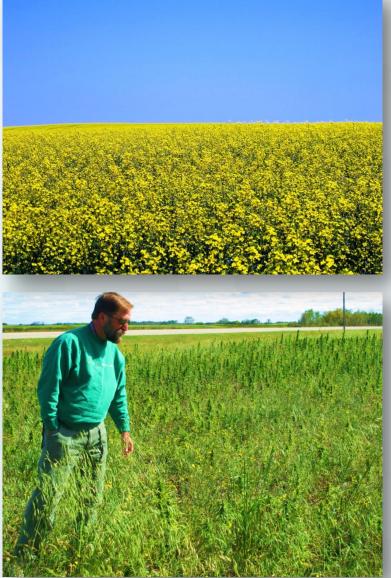

Hemp – a crop like no other

- Framers know how to grow staple crops in Alberta (wheat, canola, barley)
- Hemp is different you have to know what are you growing for and adapt cultivation practices accordingly
- Get licence and contract
 from a buyer/processor
 InnoTech
